

SCOTTISH BORDERS COUNCIL

About the project:

Scottish Borders Council covers the most south easterly corner of Scotland and is bordered by the City of Edinburgh, Dumfries and Galloway, East Lothian, South Lanarkshire, and by the English counties of Cumbria and Northumberland.

As with all local authorities, Scottish Borders Council owns and manages a considerable portfolio of public buildings, each requiring a reliable programme of on-going maintenance. Following a successful bid, DTG was appointed to supply all maintenance and repair work for its fleet of standby power generators.

Service supplied:

Pre-planned maintenance contract.

Application:

Our dedicated servicing team conducts a pre-planned monthly service on all of the council-owned generators. Located throughout the council region, in a variety of public buildings including the council head quarters, town halls, community hospitals, residential homes and leisure facilities, the generator portfolio includes an assortment of equipment of various ages and specifications, and from an array of different manufacturers.

Regular maintenance and inspections not only improves generator efficiency but also allows any minor problems to be detected and corrected before becoming a major issue that could prevent the generator from operating as it should during an emergency.

Why DTG?

With more than 1,250 generators on contract across the whole of the UK, our team of highly trained engineers with fully equipped service vehicles, all with onboard parts and backed up by the latest service management systems, means we can be relied upon to provide a reliable, high quality service.

What the client says:

"The team at DTG provide us with a reliable service to check the integrity of our generators. This pro-active approach ensures we have a completely transparent view on how our equipment is performing and dictates the programme of repairs and upgrades to ensure our standby systems can be called upon when needed most."
